Overview

- The analysis evaluates the shipping company's delivery performance, accuracy and cost efficiency to determine whether continuing the partnership is viable.
- It focuses on four main areas:

1- status

3- Distance

2- Estimation

4- Price

status

Status of Delivery

- Delivery operations show strong efficiency, with the majority of shipments arriving early.
- Late deliveries, though minimal, will be further examined to pinpoint potential causes and improvements.

Late delivery % per state

- Although Sao Paulo (SP) and Rio de Janeiro (RJ) record the highest share of late deliveries, Alagoas (AL) and Maranhão (MA) have the highest delay ratios per order.

Late% per order

- This shows that SP and RJ delays are driven by high delivery volumes, while AL and MA delays indicate efficiency issues.

Average days to dispatch per state

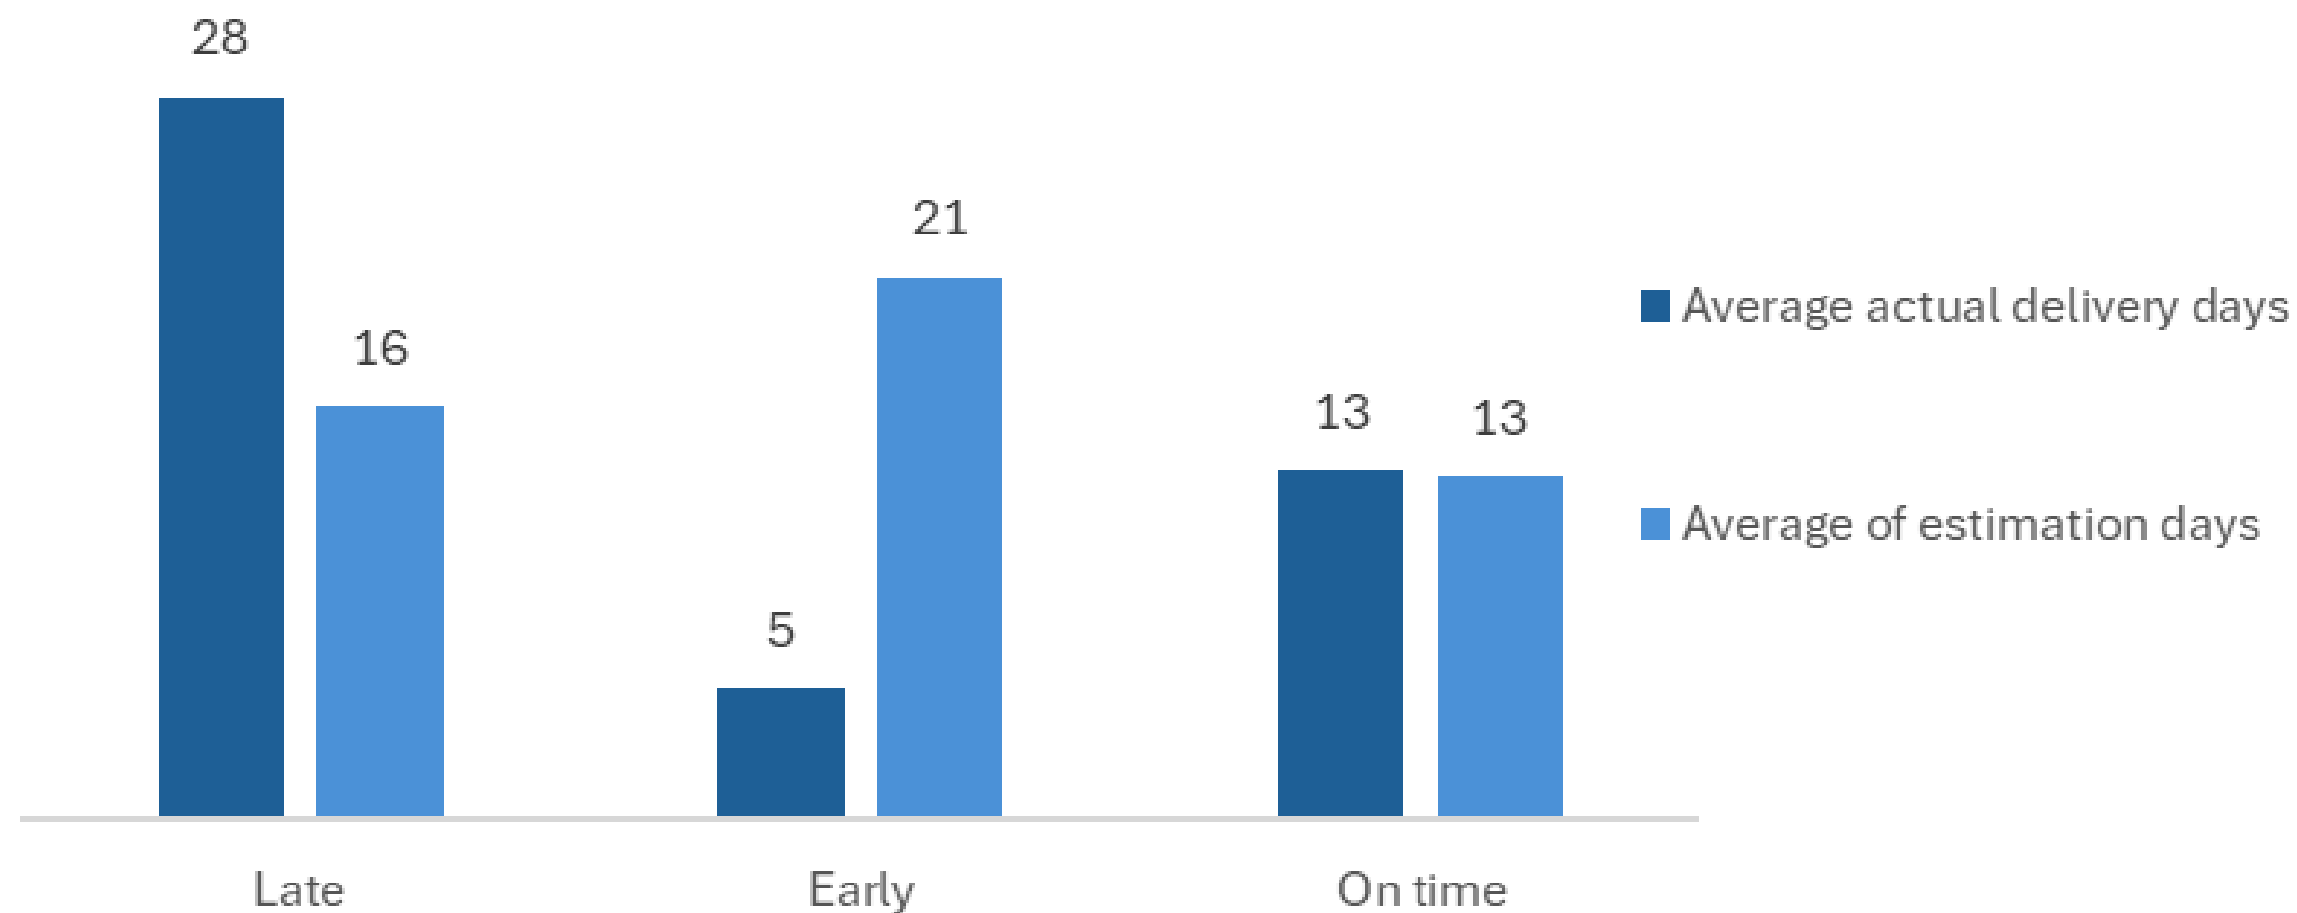

- Sao Paulo (SP) has the longest dispatch time
- Most states dispatch within 4–6 days, showing consistent performance.
- States with higher late-delivery rates, such as SP also have longer dispatch times, indicating that delays originate from the seller side rather than the shipping process.

Estimation

Actual days vs Estimated days

- **Late orders:** 12 days difference → underestimated.
- **Early orders:** 16 days difference → overestimated.
- **On-time:** accurate.
- Estimation model needs adjustment.

Distance

Here we will investigate the lates on states that have +15% of lates per order.

Estimation and distance

Average of estimation days

(Filtered: States with +15% late orders)

Category	Distance (km)
Short distance	0-100
Medium distance	101-500
Long distance	501-1000
Very long distance	1000+

- Estimation days increase with distance, however, very long routes remain underestimated .
- Adjusting estimates would help reduce late deliveries.

Average of distance (km)

- Distance is consistent across all status
- Indicates distance isn't the main cause of delays.

(Filtered: States with +15% late orders)

Early vs Late orders based on distance

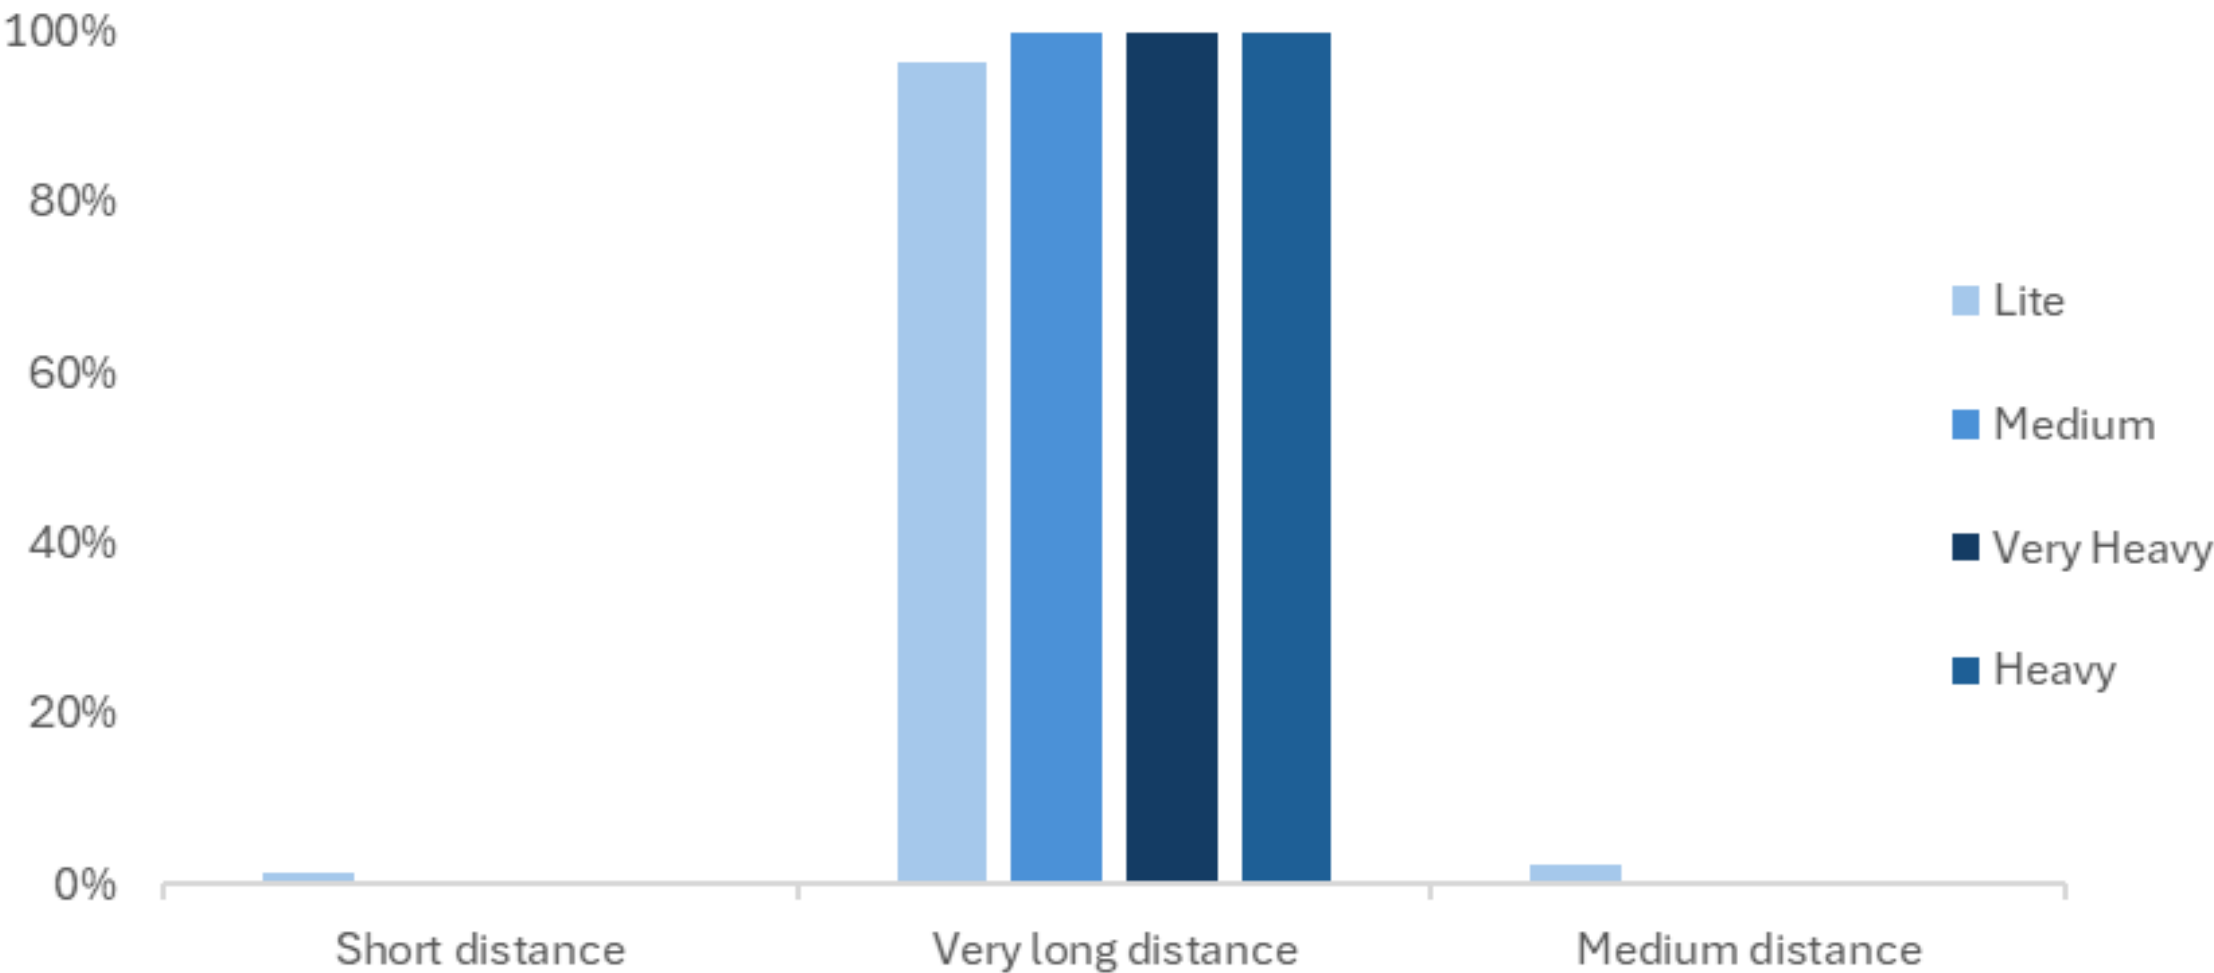

Category	Distance (km)
Short distance	0-100
Medium distance	101-500
Long distance	501-1000
Very long distance	1000+

(Filtered: States with +15% late orders)

This graph shows that most of the orders come from very long-distance routes (both late and early). This confirms that delays are mainly driven by dispatch or estimation issues rather than distance itself.

distance vs weight % of late orders

Category	Weight
Lite	0-1 kg
Medium	2-5 kg
Heavy	6-10 kg
Very Heavy	10+ kg

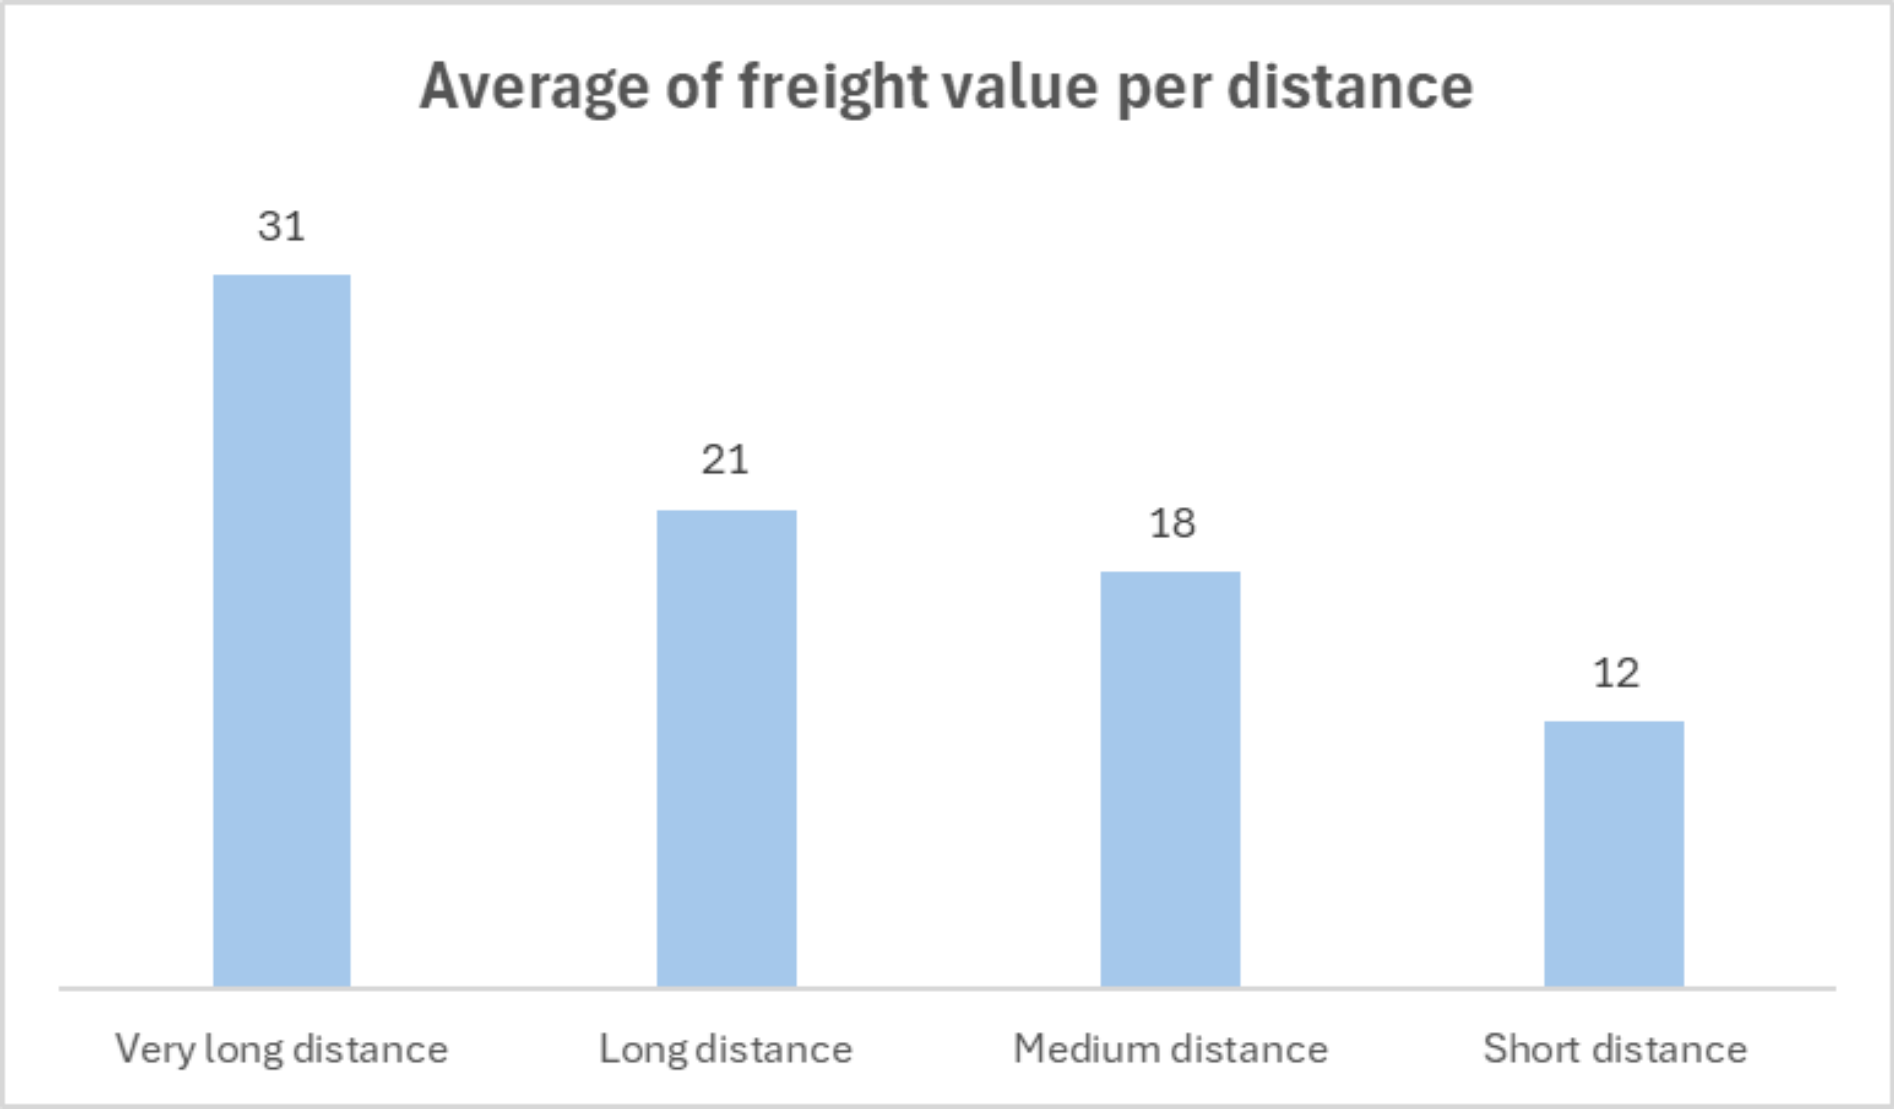

(Filtered: States with +15% late orders)

- Most of late orders are from very long distance routes across all weights.
- Delays are not weight-related

Price

Shipping Company	Average Freight Range
Current Company	12 - 31 R\$
Correios	30 – 50 R\$
Loggi	35 – 60 R\$
DHL Express	90 – 150 R\$
FedEx Brazil	80 – 140 R\$
Shippify	40 – 70 R\$

- Current company offers the lowest cost (R\$ 12-31) in the market.

Recommendations

- Continue partnering with the current shipping company, as it demonstrates strong cost efficiency and reliable short to medium distance performance.
- Adjust estimated delivery days for very long distance routes to reduce late deliveries and better align customer expectations.
- Track long distance shipments regularly to ensure consistent improvement and maintain service reliability.
